## Radio Data System (RDS) Features

With your audio system, you can utilize many convenient features provided by the Radio Data System (RDS).

The Alternative Frequencies (AF) function turns on automatically when you turn the system on. If the station you are listening to is an RDS station, the frequency display will disappear and the station name will be displayed. Then, the system will automatically keep selecting the frequency with the strongest signal from the frequencies that carry the same programs. This can save you the trouble of re-tuning to obtain the same station as long as you are in the same RDS network area.

When the signals of the RDS station become so weak that the system can no longer follow the station, the system will hold the last tuned frequency and the display will change from the station name to the frequency.

### ***U1, U2 Button***

With the UKW (FM) band selected, you can keep listening to the same station even if its frequency changes as you enter different regions while you are travelling.
