

## Throttle Cable Inspection

**WARNING:** For safe operation and positive engine response, the throttle cable must be properly adjusted.

Check for smooth rotation of the throttle grip from the fully open to the fully closed position. Check both when at full left and full right steering positions. Inspect the condition of throttle cable ① from the throttle grip down to the carburetor. If the cable is kinked, chafed or improperly routed, it should be replaced and/or re-routed. Recheck cable for tension or stress at both full left and full right steering positions.
