

Riding the Motorcycle

Braking

- Apply front and rear wheel brakes simultaneously in order to maximize braking effect.
 - Avoid unnecessarily heavy braking. It may lock the wheels and the vehicle may lose its stability.
 - Wheels are likely to lock and brake-stop distance increases when the road surface is wet. Keep riding speed lower in such a condition.
 - Continuous braking should be avoided as it may raise the brake temperature and reduce braking effectiveness.
- Braking effectiveness is reduced when riding in the rain and when riding over any wet surface. Check the braking function by gently applying brakes at low speed in open area. If braking effectiveness is bad and brakes are wet, apply brakes and ride at low speed for a while to dry the brakes.
