## Rear Suspension Damping

### Rebound Damping

The rebound damping adjuster is located at the lower end of the shock absorber.

It has at least 16 positions. Turning the adjuster one full turn advances the adjuster 4 positions.

To avoid damage to the damping adjuster, do not keep it in the full hard position.

To adjust to the standard position:

LEFT SIDE

(1) rebound damping adjuster  
 (2) punch mark  
 (3) reference mark

1. Turn the adjuster (1) clockwise until it will no longer turn (lightly seats). This is the full hard position.
2. Turn the adjuster counterclockwise 10 clicks until the punch mark (2) on the adjuster aligns with the reference mark (3) at the lower end of the shock absorber.

(cont'd)
