

Checking the engine oil

1. Start the engine and let it idle for around 3 minutes.
2. Stop the engine and wait 3 minutes.
3. Support the motorcycle in an upright position on level surface.
4. Remove the oil filler cap / dipstick and wipe the oil with a clean cloth.
5. Insert the dipstick without screwing it in, remove it and check the oil level.

If the oil level is below or near the lower level line on the dipstick, add the recommended engine oil to the upper level line through the oil filler hole.
