

Seat Belts

Your Honda SXS is equipped with lap/shoulder seat belts in each seating position. A seat belt keeps you connected to the vehicle so you won't be thrown out during a crash or rollover. Together with a proper helmet, a seat belt is your best protection against serious injuries in any type of crash, so make sure all occupants always buckle up before driving.

3 WARNING

Not wearing a seat belt, or wearing one improperly, can result in serious injury or death in a crash or rollover.

Make sure the driver and any passengers always wear their seat belts properly.

Of course, seat belts cannot completely protect you in every crash. But in most cases, seat belts can reduce your risk of serious injury.

Seat Belt Interlock System

When the driver's seat belt is not latched properly, the maximum vehicle speed will be limited by the seat belt interlock system.

If the seat belt interlock system activates:

- The maximum vehicle speed will be limited to no more than 15 mph (24 km/h).
- The seat belt indicator and speedometer will blink simultaneously.

To deactivate the seat belt interlock system:

1. Latch the driver's seat belt properly.
2. If the vehicle is moving, the throttle must be released for one second.

The seat belt indicator and speedometer will stop blinking after proper deactivation.
